

# Microprocessors

# Questions?

# Quiz

# Connecting Assembly Language to C

- Our C compiler is responsible for translating our code into Assembly Language
- Today, we rarely program in Assembly Language
  - Embedded systems are a common exception
  - Also: it is useful in some cases to view the assembly code generated by the compiler

# An Example

A C code snippet:

```
if(B < A) {  
    D += A;  
}
```

# An Example

A C code snippet:

```
if(B < A) {  
    D += A;  
}
```

The Assembly :

```
LDS R1 (A)  
LDS R2 (B)  
CP R2, R1  
BRGE 3  
LDS R3 (D)  
ADD R3, R1  
STS (D), R3
```

.....

# An Example

A C code snippet:

```
if(B < A) {  
    D += A;  
}
```

Load the contents of memory  
location A into register 1

The Assembly :

LDS R1 (A) ← PC

LDS R2 (B)

CP R2, R1

BRGE 3

LDS R3 (D)

ADD R3, R1

STS (D), R3

.....

# An Example

A C code snippet:

```
if(B < A) {  
    D += A;  
}
```

Load the contents of memory  
location B into register 2

The Assembly :

LDS R1 (A)

LDS R2 (B) ← PC

CP R2, R1

BRGE 3

LDS R3 (D)

ADD R3, R1

STS (D), R3

.....

# An Example

A C code snippet:

```
if(B < A) {  
    D += A;  
}
```

Compare the contents of register  
2 with those of register 1

This results in a change to the  
status register

The Assembly :

LDS R1 (A)

LDS R2 (B)

CP R2, R1 ← PC

BRGE 3

LDS R3 (D)

ADD R3, R1

STS (D), R3

.....

# An Example

A C code snippet:

```
if(B < A) {  
    D += A;  
}
```

Branch If Greater Than or Equal To:  
jump ahead 3 instructions if true

The Assembly :

LDS R1 (A)

LDS R2 (B)

CP R2, R1

BRGE 3

LDS R3 (D)

ADD R3, R1

STS (D), R3

.....

← PC

# An Example

A C code snippet:

```
if(B < A) {  
    D += A;  
}
```

Branch if greater than or equal to  
will jump ahead 3 instructions if  
true

The Assembly :

LDS R1 (A)

LDS R2 (B)

CP R2, R1

BRGE 3

LDS R3 (D)

ADD R3, R1

STS (D), R3

.....

if true

PC

# An Example

The Assembly :

LDS R1 (A)

LDS R2 (B)

CP R2, R1

BRGE 3

if not true

LDS R3 (D)

**PC**

ADD R3, R1

STS (D), R3

.....

A C code snippet:

```
if(B < A) {
```

```
    D += A;
```

```
}
```

Not true: execute the next instruction

# An Example

A C code snippet:

```
if(B < A) {  
    D += A;  
}
```

Load the contents of memory  
location D into register 3

The Assembly :

LDS R1 (A)

LDS R2 (B)

CP R2, R1

BRGE 3

LDS R3 (D) ← PC

ADD R3, R1

STS (D), R3

.....

# An Example

A C code snippet:

```
if(B < A) {  
    D += A;  
}
```

Add the values in  
registers 1 and 3 and  
store the result in  
register 3

The Assembly :

LDS R1 (A)

LDS R2 (B)

CP R2, R1

BRGE 3

LDS R3 (D)

 ADD R3, R1  **PC**

STS (D), R3

.....

# An Example

A C code snippet:

```
if(B < A) {  
    D += A;  
}
```

Store the value in register  
3 back to memory  
location D

The Assembly :

LDS R1 (A)

LDS R2 (B)

CP R2, R1

BRGE 3

LDS R3 (D)

ADD R3, R1

STS (D), R3 ← PC

.....

# Take-Aways

Instructions are the “atomic” actions that are taken by the processor

- Many different component work together to execute a single instruction
- One line of C code typically translates into a sequence of several instructions
- In the mega 2560, most instructions are executed in a single clock cycle

The high-level view is important here: you won't be compiling programs on exams

# Components of a Microprocessor

What are they?

# Components of a Microprocessor

- Memory:
  - Storage of data
  - Storage of a program
  - Either can be temporary or “permanent” storage
- Registers: small, fast memories
  - General purpose: temporarily store arbitrary data
  - Special purpose: used to control the processor

# Components of a Microprocessor

- Instruction decoder:
  - Translates current program instruction into a set of control signals
- Arithmetic logical unit:
  - Performs both arithmetic and logical operations on data: add, subtract, multiply, AND, OR ...
- Input/output control modules

# Components of a Microprocessor

- Many of these components must exchange data with one-another
- It is common to use a 'bus' for this exchange

# Buses

- In the simplest form, a bus is a single wire
- Many different components can be attached to the bus
- Any component can take input from the bus or place information on the bus

# Buses

- At most one component may write to the bus at any one time
- In a microprocessor, which component is allowed to write is usually determined by the code that is currently executing

# Collections of Bits

- A data bus typically captures a set of bits simultaneously
- Need one wire for each of these bits
- In the Atmel Mega2560: the data bus is 8-bits “wide”
- In your laptops: 32 or 64 bits

# Atmel Mega2560 Architecture

# Atmel Mega2560

8-bit data bus

- Primary mechanism for data exchange

# Memory

What are the essential components of a memory?

# A Memory Abstraction

- We think of memory as an array of elements – each with its own address
- Each element contains a value
  - It is most common for the values to be 8-bits wide (so a byte)

# A Memory Abstraction

- We think of memory as an array of elements – each with its own address
- Each element contains a value
  - It is most common for the values to be 8-bits wide (so a byte)

Stored value

Address

# Memory Operations

## Read

`foo (A+5) ;`

reads the value from the memory location referenced by the variable 'A' and adds the value to 5. The result is passed to a function called `foo ( ) ;`

# Memory Operations

Write

`A = 5;`

writes the value 5 into the memory location referenced by 'A'

# Types of Memory

## Random Access Memory (RAM)

- Computer can change state of this memory at any time
- Once power is lost, we lose the contents of the memory
- This will be our data storage on our microcontrollers

# Types of Memory

## Read Only Memory (ROM)

- Computer **cannot** arbitrarily change state of this memory
- When power is lost, the contents are maintained

# Types of Memory

## Erasable/Programmable ROM (EPROM)

- State can be changed under very specific conditions (usually not when connected to a computer)
- Our microcontrollers have an Electrically Erasable/Programmable ROM (EEPROM) for program storage
  - Also called *Flash Memory*

# Atmel Mega2560 Architecture

# Atmel Mega2560

32 general purpose registers

- 8 bits wide
- 3 pairs of registers can be combined to give us 16 bit registers

# Atmel Mega2560

Special  
purpose  
registers

- Control of the  
internals of  
the  
processor

# Atmel Mega2560

Random Access  
Memory (RAM)

- 8 KByte in size

# Atmel Mega2560

Random Access  
Memory (RAM)

- 8 KByte in size

Note: in high-end  
processors,  
RAM is a  
separate  
component

# Atmel Mega2560

## Flash (EEPROM)

- Program storage
- 256 KByte in size

# Atmel Mega2560

## Flash (EEPROM)

- In this and many microcontrollers, program and data storage is separate
- Not the case in our general purpose computers

# Atmel Mega2560

## EEPROM

- Permanent data storage

# Atmel Mega2560

- Arithmetic  
Logical Unit
- Data inputs from registers
  - Control inputs not shown (derived from instruction decoder)

# Machine-Level Programs

Machine-level programs are stored as sequences of *atomic* machine instructions

- Stored in program memory
- Execution is generally sequential (instructions are executed in order)
- But – with occasional “jumps” to other locations in memory

# Types of Instructions

- Memory operations: transfer data values between memory and the internal registers
- Mathematical operations: ADD, SUBTRACT, MULT, AND, etc.
- Tests:  $\text{value} == 0$ ,  $\text{value} > 0$ , etc.
- Program flow: jump to a new location, jump conditionally (e.g., if the last test was true)

# Mega2560: Decoding Instructions

## Program counter

- Address of currently executing instruction

# Mega2560: Decoding Instructions

Instruction register

- Stores the machine-level instruction currently being executed

# Atmel Mega2560

Instruction decoder

- Translates current instruction into control signals for the rest of the processor

# Atmel Instructions

# Some Mega2560 Memory Operations

**LDS Rd, k**

We refer to this as  
“Assembly Language”

- Load SRAM memory location k into register Rd
- $Rd \leftarrow (k)$

**STS Rd, k**

- Store value of Rd into SRAM location k
- $(k) \leftarrow Rd$

# Load SRAM Value to Register

LDS Rd, k

# Store Register Value to SRAM

STS Rd, k

# Some Mega2560 Arithmetic and Logical Instructions

## **ADD Rd, Rr**

- Add Rd and Rr (these are registers)
- Operation:  $Rd \leftarrow Rd + Rr$

## **ADC Rd, Rr**

- Add with carry
- $Rd \leftarrow Rd + Rr + C$

# Add Two Register Values

## ADD Rd, Rr

- Fetch register values

# Add Two Register Values

## ADD Rd, Rr

- Fetch register values
- ALU performs ADD

# Add Two Register Values

## ADD Rd, Rr

- Fetch register values
- ALU performs ADD
- Result is written back to register via the data bus

# Some Mega2560 Arithmetic and Logical Instructions

**NEG Rd**: take the two's complement of Rd

**AND Rd, Rr**: bit-wise AND with a register

**ANDI Rd, K**: bit-wise AND with a constant

**EOR Rd, Rr**: bit-wise XOR

**INC Rd**: increment Rd

**MUL Rd, Rr**: multiply Rd and Rr (unsigned)

**MULS Rd, Rr**: multiply (signed)

# An Example

```
#include "oulib.h"

volatile uint8_t a = 10;

int main (void)
{
    a = a+5;

    while(1) {
        delay_ms(++a);
    };
}
```

0000013c <main>:

```
volatile uint8_t a = 10;
```

```
int main (void)
```

```
{
```

```
    a = a+5;
```

```
13c:    80 91 00 02    lds     r24, 0x0200
140:    8b 5f          subi    r24, 0xFB          ; 251
142:    80 93 00 02    sts     0x0200, r24
```

```
    while(1) {
```

```
        delay_ms(++a);
```

```
146:    80 91 00 02    lds     r24, 0x0200
14a:    8f 5f          subi    r24, 0xFF          ; 255
14c:    80 93 00 02    sts     0x0200, r24
150:    80 91 00 02    lds     r24, 0x0200

```

**We have doubled  
the number of  
memory  
operations!**

# Take-Home Message I

We want to carefully choose our data types

- Smaller variables are handled more efficiently
- But: we need to make sure that the results of the math that we do with these variables fits in the size that we have chosen
  - Intermediate values must fit, too!

# Take-Home Message II

- A line of C code usually translates into a sequence of atomic instructions
- Most instructions are executed in one cycle of the system clock
- For a given instruction, many different components work together to make that instruction happen
  - Program counter, instruction register and decoder, general and special purpose registers, memory, ALU, etc.

# Take-Home Message III

- You should know what these different components are and what they do at an abstract level
- You don't need to know the details of the assembly language or how these details relate to specific lines of C code

# Next Time

- Project 8
